

PACKAGING ENHANCEMENT SYSTEM

SECUROnco+

Defining Safety in Oncology Products

1. **Breakage Prevention:** SECUROnco+ plastic base and shoulder protectors* reinforce the vial at critical areas.
2. **Plastic Sheathing:** Its presence up to the aluminum cap reduces contact with potential cytotoxic contaminants on the vial's exterior and helps contain spills if the vial is damaged. The plastic sheathing does not interfere with chemotherapy preparation and administration equipment.
3. Labeling as per **ISMP Standards**.
4. **Cytotoxic symbol** on the label as an additional warning.
5. **Easily scannable barcode**.
6. **Latex-free product** symbol present on the packaging.

* The protective shoulder is currently only present for vials between 10 mL and 100 mL. While 5 mL vials are equipped with the plastic base and shrink sleeve, 2 mL vials do not have any additional protection as their small size already makes them highly resistant to breakage.

As a provider of sterile oncology injectable products, **Omega Laboratories Limited** is strongly committed to minimizing potential risks to the health and safety of health care professionals handling its products.

For this reason, Omega has developed its **SECUROnco+** system. The **SECUROnco+** system consists of a **white plastic rigid bottom** and a **white plastic rigid shoulder** placed on a thoroughly decontaminated labeled vial, all of which are **shrink-wrapped** up to the aluminum capsule. The plastic base and shoulder provide additional protection should the vial fall. In addition, the base provides additional stability to the vial and the protective sheathing does not interfere with chemotherapy preparation and administration equipment.

In summary, the **SECUROnco+** packaging enhancement system protects health care professionals against potential cytotoxic surface residue, increases the vial's resistance to breakage and helps contain spills in case of breakage.
